Candidate's Declaration	xv
Supervisor's Declaration	xvi
Abstract	xvii
Aims	xx
Chapter 1. Introduction.....	1
1.1.
GABA and the GABA receptors.....	2
1.1.1. GABA and the GABA receptors: a brief history	2
1.1.2. GABA synthesis, metabolism, release and re-uptake	7
1.1.2.1. Synthesis.....	7
1.1.2.2. Metabolism.....	8
1.1.2.3. Release	8
1.1.2.4. Re-uptake	9
1.1.3. GABA _A R structure and heterogeneity	14
1.1.3.1. Molecular structure and activation.....	14
1.1.3.2. Cloning of the GABA _A R subunits	19
1.1.3.3. Cloning of the ρ subunits	21
1.1.3.4. Native GABA _A R subtypes	22
1.1.4. GABA: a pioneer neurotransmitter	24
1.1.5. Forms of GABA mediated inhibition in the brain	27
1.1.5.1. Phasic inhibition.....	27
1.1.5.2. Tonic inhibition.....	27
1.1.5.3. Spillover inhibition	29
1.1.6. Regulation of subunit composition: influence on GABA _A R biophysics and cellular expression	32
1.1.6.1 The α subunits	32
1.1.6.2. The β subunits	36
1.1.6.3. The γ subunits	37

1.1.6.4. The δ subunits	38
1.1.7. Tonic conductances mediated by δ -GABA _A Rs: physiological functions.....	40
1.1.8. GABA _A R pharmacology.....	42
1.1.8.1. GABA _A R agonists and antagonists.....	43
1.1.8.2. Benzodiazepines.....	45
1.1.8.3. General anaesthetics: etomidate, propofol and barbiturates	49
1.2. Neurosteroids	51
1.2.1. Neurosteroids: a brief history.....	51
1.2.2. The brain is a steroidogenic organ	52
1.2.3. The neurosteroid binding site(s).....	54
1.2.4. Neurosteroid biosynthesis	59
1.2.5. Neurosteroid modulation of synaptic GABA _A Rs	62
1.2.5.1. Presynaptic	62
1.2.5.2. Postsynaptic	62
1.2.6. Regulators of neurosteroid sensitivity.....	62
1.2.6.1. Phosphorylation	63
1.2.6.2. Metabolism	65
1.2.6.3. Subunit composition	68
1.2.7. Extrasynaptic GABA _A Rs: a target for endogenous neurosteroids?.....	68
1.2.8. Trophic neurosteroid actions during development	71
1.2.9. GABA _A R-mediated currents during development: a role for neurosteroids? ...	74
1.2.10. GABA _A R expression in the VB nucleus during development	77
1.2.11. GABA _A R expression in cortical L2/3 pyramidal neurones during development	79
Chapter 2. Materials and Methods.....	84
2.1. Patch-clamp technique: a historical perspective	85
2.2. Breeding and housing of transgenic mice	90
2.3. Brain slice preparation	91
2.4. Visualisation of neurones	92
2.4.1. Identification of L2/3 pyramidal neurones of the neocortex.....	93
2.4.2. Identification of L2/3 interneurones of the neocortex.....	93
2.4.3. Identification of VB neurones	94

2.5. Patch-clamp electrophysiological recordings	95
2.6. mIPSC analysis	96
2.7. Tonic and drug evoked inward current analysis	99
2.8. Drug and solution application	100
2.9. Statistical analysis	101
Chapter 3. A pharmacological investigation of GABA_A receptor-mediated inhibition in VB neurones.....	102
3.1. An investigation of inhibitory neurotransmission in WT P17-24 VB neurones...	103
3.1.1. The properties of mIPSCs recorded from VB neurones	103
3.1.2. The effect of postnatal age on the properties of mIPSCs recorded from WT P17-24 VB neurones	108
3.1.3. The lack of effect of gender on the properties of mIPSCs recorded from WT P17-24 VB neurones	111
3.1.4. The properties of the extrasynaptic, tonic conductance of VB neurones.....	112
3.2. A characterisation of GABA _A R-mediated inhibition in VB neurones of $\alpha 4^{0/0}$ mice	115
3.2.1. Synaptic inhibition	115
3.2.2. Tonic inhibition.....	120
3.3. The contribution of δ subunit containing GABA _A Rs to inhibitory transmission in VB neurones	123
3.3.1. A comparison of the actions of THIP on WT and $\alpha 4^{0/0}$ VB neurones: synaptic and extrasynaptic GABA _A Rs.....	123
3.3.2. A comparison of the actions of DS2 on WT and $\alpha 4^{0/0}$ VB neurones: synaptic and extrasynaptic GABA _A Rs.....	126
3.3.3. A comparison of the actions of 5 α -pregnan-3 α -ol-one on WT and $\alpha 4^{0/0}$ VB neurones: synaptic and extrasynaptic GABA _A Rs.....	129
3.4. A comparison of the effects of co-application of DS2 and THIP on the tonic conductance of WT VB neurones.....	135
3.5. A comparison of the effects of co-application of 5 α 3 α and THIP on the tonic conductance of WT VB neurones.....	137

Chapter 4. Endogenous neurosteroid interactions with GABA_A receptor-mediated inhibition in VB neurones during postnatal development	141
4.1. The effect of postnatal age on the properties of mIPSCs recorded from WT VB neurones	142
4.2. The effects of finasteride pre-treatment on mIPSCs from P7 WT VB neurones .	146
4.3. The effects of α - and γ -cyclodextrin pre-incubation on mIPSCs from P7 WT VB neurones	148
4.4. The effects of γ -cyclodextrin pre-incubation on mIPSCs from WT VB neurones during development	151
4.5. The effects of intracellular application of γ -CD on mIPSCs from P7 WT VB neurones	154
4.6. Defining the temporal profile of intracellular γ -CD action.....	159
4.7. The effect of exogenous $5\alpha 3\alpha$ application upon the mIPSCs recorded from P7 WT VB neurones.	163
4.8. The effects of 5α -dihydroprogesterone pre-incubation on mIPSCs recorded from P20-24 WT VB neurones.....	165
Chapter 5. Endogenous neurosteroid interactions with GABA_A receptor-mediated inhibition in cortical layer 2/3 neurones during postnatal development	170
5.1. The effect of postnatal age on the properties of mIPSCs recorded from WT L2/3 pyramidal neurones.....	171
5.2. The effects of finasteride pre-treatment on mIPSCs recorded from P7 WT L2/3 pyramidal neurones.....	175
5.3. The effects of α - and γ -cyclodextrin pre-incubation on mIPSCs recorded from P7/8 WT L2/3 pyramidal neurones.....	177
5.4. The effects of γ -CD pre-incubation on mIPSCs recorded from WT L2/3 pyramidal neurones during postnatal development	180
5.5. The effects of intracellular γ -CD application on mIPSCs recorded from WT L2/3 pyramidal neurones during postnatal development	183
5.6. The effects of γ -CD pre-incubation on mIPSCs recorded from $\alpha 1^{0/0}$ L2/3 pyramidal neurones during postnatal development	187
5.7. The effects of intracellular γ -CD application on mIPSCs recorded from L2/3 GAD67-GFP+ neurones during postnatal development.....	192

Chapter 6. Discussion	197
6.1. The properties of mIPSCs from VB neurones	198
6.2. The properties of the tonic current recorded in VB neurones.....	201
6.3. Inhibitory neurotransmission in VB neurones: relevance to thalamic function.....	203
6.4. Deletion of the $\alpha 4$ subunit disrupts both tonic and synaptic inhibition in VB neurones	207
6.5. THIP selectively enhances tonic inhibition in WT, but not $\alpha 4^{0/0}$, VB neurones...	211
6.6. $\alpha 4^{0/0}$ VB neurones exhibit a residual tonic conductance that is enhanced by THIP	212
6.7. DS2 selectively enhances tonic inhibition in WT, but not $\delta^{0/0}$, VB neurones.....	214
6.8. Low concentrations of $5\alpha 3\alpha$ do not selectively enhance tonic inhibition in VB neurones.	214
6.9. The developmental speeding of inhibitory synaptic transmission: a role for neurosteroids?	219
6.10. A developmentally regulated endogenous neurosteroid tone prolongs mIPSCs	222
6.10.1. VB neurones.....	223
6.10.2. L2/3 pyramidal neurones.....	224
6.11. γ -CD: the impact of non-specific actions.....	226
6.12. The regulation of the neurosteroid tone influencing GABA _A Rs during development	229
6.13. Intracellular γ -CD treatment	234
6.14. Putative autocrine actions of neurosteroids.....	235
6.15. Physiological implications of a neurosteroid tone influencing mIPSCs during development	240
Chapter 7. Summary and Conclusions	243

ABBREVIATIONS

$\alpha 1^{0/0}$	GABA _A R $\alpha 1$ subunit “knockout”
$\alpha 4^{0/0}$	GABA _A R $\alpha 4$ subunit “knockout”
$\delta^{0/0}$	GABA _A R δ subunit “knockout”
3 α -HSD	3 α -hydroxysteroiddehydrogenase
3 β -HSD	3 β -hydroxysteroid dehydrogenase
5 α 3 α	5 α -pregnan-3 α -ol-20-one
5 α 3 β	5 α -pregnan-3 β -ol-20-one
5 β 3 α	5 β -pregnan-3 α -ol-20-one
5 β 3 β	5 β -pregnan-3 β -ol-20-one
5 α -THDOC	5 α -pregnan-3 α ,21-diol-20-one or 5 α -tetrahydrodeoxycorticosterone
5-HT ₃	5-hydroxytryptamine type 3 receptor
5 α -DHP	5 α -dihydroprogesterone or 5 α -pregnane-3,20-dione
5 α -R	5 α -reductase
α -CD	α -cyclodextrin
β -CD	β -cyclodextrin
γ -CD	γ -cyclodextrin
$\gamma 2S$	Short splice variant of GABA _A receptor $\gamma 2$ -subunit
$\gamma 2L$	Long splice variant of GABA _A receptor $\gamma 2$ -subunit
τ_w	Weighted decay time constant of mIPSC decay
aCSF	Artificial cerebrospinal fluid
AMPA	α -amino-3-hydroxy-5-methyl-4-isoxazolepropionic acid type glutamate receptor
ANOVA	Analysis of variance statistical test
ATP	Adenosine triphosphate
BGT-1	Betaine/GABA transporter
[Ca ²⁺] _i	Intracellular Ca ²⁺ concentration
CaMKII	Ca ²⁺ -calmoduline-dependent protein kinase II
CGC	Cerebellar granule cell
CNS	Central nervous system
DGGC	Dentate gyrus granule cell
DHEA	Dehydroepiandrosterone
dLGN	Dorsolateral geniculate nucleus of the thalamus

DMCM	6,7,dimethoxy-4-ethyl- β -carboline-3-carboxylic acid Methyl ester
DMSO	Dimethylsulphoxide
DRG	Dorsal root ganglion
DS2	4-chloro-N-[2-(2-thienyl)imidazo[1,2-a]pyridine-3-yl benzamide
EC ₅₀	The concentration of compound producing 50% of the maximal effect
E _{Cl⁻}	Reversal potential for chloride ions
ECS	Extracellular solution
EGTA	Ethylene glycol-bis(β -aminoethyl-ether)-N,N,N'N' tetracetic acid
eIPSC	Evoked inhibitory postsynaptic current
EPSC	Excitatory postsynaptic current
EPSP	Excitatory postsynaptic potential
GABA	γ -aminobutyric acid
GABA _A R	γ -aminobutyric acid type A receptor
GABA _B R	γ -aminobutyric acid type B receptor
GABA _C R	γ -aminobutyric acid type C receptor
GABA-T	GABA transaminase
GAD	Glutamic acid decarboxylase
GAE	Generalised absence epilepsy
GFP	Green fluorescent protein
GAT ₁₋₄	GABA transporter types 1-4
HEPES	N-2-Hydroxyethylpiperazine-N'2-ethanesulphonic acid
IEI	Inter-event interval
IPSC	Inhibitory postsynaptic current
IPSP	Inhibitory postsynaptic potential
I-V	Current-voltage
KS	Kolmogorov-Smirnov statistical test
LORR	Loss of righting reflex
LTS	Low threshold spike
L1	Layer 1 of the neocortex
L2/3	Layer 2 and 3 of the neocortex
L4	Layer 4 of the neocortex

L5	Layer 5 of the neocortex
L6	Layer 6 of the neocortex
mIPSC	Miniature inhibitory postsynaptic current
mEPSC	Miniature excitatory postsynaptic current
mRNA	Messenger ribonucleic acid
NMDA	N-methyl-D-aspartate type glutamate receptor
nACh	Nicotinic acetylcholine receptor
nRT	<i>nucleus reticularis</i> of the thalamus
P	Postnatal day
PKA	cAMP-dependent protein kinase
PKC	Protein kinase C
PKC _ε	Protein kinase C, epsilon isoform
PNS	Peripheral nervous system
PPD	Post-partum dysphoria
PREG	Pregnenolone
PROG	Progesterone
P450 _{SCC}	Cytochrome P450 cholesterol side-chain cleavage
RM ANOVA	Repeated measures ANOVA statistical test
RT-PCR	Reverse transcription-polymerase chain reaction
SEM	Standard error of the mean
SON	Supraoptic nucleus of the hypothalamus
SSRI	Selective serotonin re-uptake inhibitor
sIPSC	Spontaneous inhibitory postsynaptic current
T50	Time taken for mIPSCs to decay by 50%
T90	Time taken for mIPSCs to decay by 90%
TBPS	<i>tert</i> -butylbicyclophosphorothionate
THIP	4,5,6,7-tetrahydroisoxazol[5,4-c]pyridin-3-ol
TM1-4	Transmembrane spanning domains 1-4
TSPO	18kDa translocator protein
TTX	Tetrodotoxin
VB	<i>Ventrobasal</i> nucleus of the thalamus
VDCC	Voltage-dependent Ca ²⁺ channel
VGAT	Vesicular GABA transporter
WT	Wild type
ZAC	Zinc activated ion channel

ACKNOWLEDGEMENTS

Conducting four years of research and distilling it in to a written thesis is an endeavour that is impossible to achieve without the help and support of numerous people. Primarily, I must express my gratitude to my supervisors, Dr. Delia Belelli and Prof. Jeremy Lambert who, from beginning to end, have provided guidance, enthusiasm and inspiration that have allowed me to develop an understanding of the subject area.

I am indebted also to many of my colleagues for their continued support and advice. Most notably, I reserve a special thank you for Dr Murray Herd whose technical expertise in all things electrophysiological has been an invaluable resource. I also thank Murray for his role as “stand-in” supervisor towards the end of my thesis compilation – a duty that he performed with characteristic no-nonsense efficiency and accuracy. Similarly, I am sincerely thankful for the reference checking contributions of Dr. Ben Gunn and Dr. Ed Maguire, who carried out this tedious task with uncharacteristic speed and diligence. Throughout my time in Dundee these colleagues have also become great friends and this has made for a productive and gratifying environment in which to conduct research. I thank Ben for providing me with a bed for my early days in Dundee and also for his impeccable reliability as a drinking/fishing/camping/skiing partner. I thank Ed for teaching me the true meaning of fiscal prudence, for expanding my musical “awareness” and for his impeccable reliability for drinking too much. Moreover, I acknowledge Matt Livesey, Michelle Cooper, Kara Panetta, Dianne Peden and Liz Mitchell for their advice, support and friendship. I thank also the British Pharmacological Society for funding.

Outside the lab, I am deeply grateful to my parents for their love, support and admiration, regardless of the pursuit to which I’m committed. I am fully aware of their positive influence on this project. Finally, I reserve my most profound gratitude for Abi. Abs, I am continually amazed by your seemingly boundless patience, thoughtfulness, love and optimism – qualities that, in my opinion, have played a significant role in the timely completion of this thesis. For this, I will always be thankful.

CANDIDATE’S DECLARATION

I declare that I am the author of this thesis and that it is a true record of the work performed by me. This thesis has not been previously submitted for application for a higher degree. All sources of information used in the preparation of this thesis have been consulted and are cited correctly. This work has been carried out in the Centre for Neuroscience, Division of Medical Sciences, University of Dundee, under the supervision of Dr. Delia Belelli, Prof. Jeremy J. Lambert and Prof. David J. K. Balfour.

Adam Brown

SUPERVISOR'S DECLARATION

I certify that Adam R. Brown has completed nine terms of experimental research and has fulfilled the conditions of Ordinance 39, University of Dundee, such that he is eligible to submit the following thesis in application for the degree of Doctor of Philosophy.

Professor J.J. Lambert

Dr D. Belelli

Professor D.J.K. Balfour

ABSTRACT

GABA_A receptors (GABA_ARs) mediate the majority of fast inhibition in the CNS and as such are crucial to neuronal function. Two distinct modes of GABA_AR mediated inhibition exist: “phasic” involves the transient activation of postsynaptic GABA_ARs following presynaptic vesicular GABA release and “tonic” whereby high-affinity extrasynaptic GABA_ARs are persistently activated by ambient GABA. GABA_ARs exhibit a rich pharmacology and are the target for a number of clinically useful compounds including benzodiazepines, barbiturates and certain general anaesthetics. In addition, several naturally occurring steroids typified by the progesterone metabolite 5 α -pregnan-3 α -ol-20-one (5 α 3 α) are potent positive allosteric modulators of GABA_AR function - a property that endows these steroids with anxiolytic, sedative and anti-convulsant actions. Importantly, in addition to importing steroids from the periphery, the brain also harbours a steroidogenic capacity and can manufacture GABA-modulatory steroids, termed “neurosteroids”, from cholesterol. Although several studies have demonstrated neurosteroids to be implicated in a variety of physiological processes including neurodevelopment, important questions remain. In particular, are neurosteroids neurone selective? Do they discriminate between particular neuronal GABA_ARs subtypes? Under what conditions do endogenous neurosteroids influence neuronal function? And importantly, which cells synthesise neurosteroids in the central nervous system?

Therefore, the principal aims of this study were: 1) to characterise the properties of GABA_AR mediated inhibition in postnatal day (P) 17-24 neurones of the mouse ventrobasal (VB) nucleus of the thalamus – neurones which have a well defined GABA_AR expression profile and which exhibit both synaptic and tonic GABA_AR mediated inhibition. 2) To investigate the effects of 5 α 3 α on synaptic and tonic GABA_AR mediated inhibition in VB neurones. 3) To investigate whether there is a role for endogenous neurosteroids in regulating synaptic GABA_AR function during postnatal

development (P7-P20) in VB neurones and 4) cortical layer 2/3 neurones – a neuronal population with a more heterogenous, and less well defined GABA_AR expression profile.

To address these aims, whole-cell voltage clamp recordings were performed on acute brain slices derived from wild type and transgenic GABA_AR subunit “knock-out” mice in conjunction with pharmacological approaches. Synaptic inhibition in WT VB neurones, as inferred by recording miniature inhibitory postsynaptic currents (mIPSCs) was characterised by relatively large amplitude and fast decaying mIPSCs. A large tonic conductance in WT VB neurones was inhibited following application of the competitive GABA_AR antagonist bicuculline (30 μM). Deletion of the α4 subunit (α4^{0/0}) revealed alteration to both synaptic and tonic inhibition. Most notably, α4^{0/0} VB neurones displayed a greatly diminished tonic conductance. These results are in agreement that the majority of extrasynaptic GABA_ARs in VB neurones contain the α4 subunit. Exogenous application of the neurosteroid 5α3α (100 nM) to WT VB neurones only modestly enhanced the tonic conductance and also gave rise to mIPSCs with prolonged decay kinetics. It is concluded 5α3α has a relatively low potency at the extrasynaptic GABA_AR population in VB neurones and furthermore that this concentration does not discriminate between synaptic and tonic inhibition.

Between P7 and P20, mIPSCs recorded from VB and L2/3 neurones became progressively faster decaying, a feature that has been associated with an increase in α1-GABA_AR subunit expression during development. However, the developmental decrease in mIPSC decay time was still observed in recordings from α1^{0/0} L2/3 pyramidal neurones indicating the contribution of additional factors. Here I show that blocking neurosteroid synthesis using the 5α-reductase inhibitor, finasteride, or treating the brain slice with the steroid-scavenger molecule, γ-cyclodextrin (γ-CD), results in significantly faster mIPSC decay times between P7 and P10 in VB and L2/3 neurones.

These results provide the first indication that an endogenous neurosteroid tone may influence the mIPSC decay kinetics of VB and L2/3 neurones during development. Moreover, compared to γ -CD pre-incubation, application of γ -CD to the intracellular compartment *via* the patch pipette was found to be equally effective thus suggesting a possible autocrine mechanism of neurosteroid action. For VB neurones at P20-24 (an age range at which the mIPSCs are insensitive to γ -CD treatment), incubation with the GABA_AR-inactive neurosteroid precursor 5 α -DHP resulted in a robust prolongation of the mIPSC decay time thus revealing the presence of functional neurosteroidogenic enzymes in the brain slice tissue.

In summary, these results reveal for the first time that during the first ~2 weeks of life the developmental decrease in the duration of the mIPSCs recorded from VB and L2/3 neurones is largely due to a reduction in local neurosteroid synthesis. Moreover, P20-24 VB neurones are capable of reinitiating neurosteroid production thus giving rise to a mechanism that may, under certain conditions, locally influence neuronal inhibition. These results may have important physiological consequences as the developmental timing of the neurosteroid tone observed here coincides with a myriad of crucial neurodevelopmental processes including the transition of GABA from a depolarising to a hyperpolarising action.

The aims of this project were:

- To characterise the properties of both the mIPSCs (mediated by synaptic GABA_ARs) and the tonic conductance (mediated by extrasynaptic GABA_ARs) in VB neurones. These studies were performed using the whole cell patch clamp technique applied to *in vitro* brain slices prepared from P17-24 wild type (WT) and $\alpha 4^{0/0}$ mice.
- To compare the effects of DS2, THIP and the neurosteroid 5 α 3 α on synaptic vs extrasynaptic GABA_ARs in P17-24 VB neurones derived from WT and GABA_AR subunit “knock-out” mice.
- To investigate the possibility that endogenous neurosteroid levels regulate synaptic GABA_AR function during postnatal development (P7-P20) in VB neurones.
- To investigate the possibility that endogenous neurosteroid levels regulate synaptic GABA_AR function during postnatal development (P7-P20) in cortical layer L2/3 pyramidal neurones and L2/3 cortical interneurones.
