ACKNOWLEDGMENTS

Throughout the duration of my research, I have been very lucky to receive guidance and support from many people around me. Firstly, I will like to thank my supervisors, Prof. Birgit Lane and Prof. Irwin McLean. I remembered Birgit offering me a cup of tea when I interviewed with her for my first job as a research officer at A*STAR in 2006. Within a few months of my research experience in the Epithelial Biology Laboratory, she offered me an opportunity to visit Irwin's human genetics laboratory in Dundee and encouraged me to consider the University of Dundee as a partner university for the commencement of my A*STAR graduate studies studentship. In June 2006, I traveled to Dundee where Irwin greeted me personally at the train station. Throughout the week in the McLean Laboratory, I learnt the technique of sequencing the filaggrin gene from Dr. Aileen Sandilands, who is always patient and ready to help.

In March 2007, I returned to the McLean Laboratory for two years to start my Ph.D studies, working under the excellent mentorship of Aileen and Irwin. I will also like to thank everyone else in the human genetics laboratory for making me so at home in Dundee – with special heart-felt thanks to Frances for being constantly around to give advice on anything; Linda and Liz for their motherly, cheerful chatter; Yiwei, Liao and Toshi for their feisty banter and Sara for her kindness and constant enthusiasm to teach.

I returned to Singapore in 2009 to complete my Ph.D research in Birgit's laboratory. I will like to acknowledge Ildiko and Terry for being the main

driving forces behind the psoriasis project during my absence in Singapore; it would also be impossible to complete the mammoth task of filaggrin gene genotyping in Singapore without the persevering assistance rendered by Rebecca, Christabelle, Anita and John. I will also like to thank Declan for being my first teacher in histology and everyone else in the laboratory for their friendship. I would like to show my utmost appreciation my supervisors, Rebecca and Kao Chin for proof reading my thesis draft to weed out grammatical errors in my times of incoherence.

I would also like to thank all the other colleagues at Ninewells Hospital and College of Life Sciences, A*STAR institutes for all technical and administrative help in my project. I would also like to show recognition to all my clinical collaborators and research staff in National Skin Centre, National University Hospital and Kandang Kerbau Women's and Children's hospital for clinical sample collection and fruitful discussion, especially Drs. Mark Tang, Jean Ho, Wen Chin Chiang and research nurses Nancy Liew, Winnie Chia and Veron Lu.

Lastly, a very big thank you to my family and friends for putting up with my elusiveness for the past few weeks during thesis writing, including my childhood friends, who asked me to 'Walk a dog, not run a gel!' during weekends, the Singaporean Girls in Scotland Gang, and all my loved ones around me who always have a ready word of encouragement for me during the course of my studies.

LIST OF ABBREVIATIONS

6-FAM	6-carboxyfluorescein
AA	alopecia areata
AD	atopic dermatitis
AGC	protein kinase A/protein kinase G/protein kinase C
ALSPAC	Avon Longitudinal Study of Parents and Children
BH	bleomycin hydrolase
CAMK	Ca ²⁺ /calmodulin-dependent protein kinase
CCM	chemical cleavage of mismatch
CDSN	corneodesmosin gene
CE	cornified envelope
CK1	casein kinase 1
CK2	casein kinase 2
CSGE	conformation sensitive gel electrophoresis
DGGE	denaturing gradient gel electrophoresis
DHPLC	denaturing high-performance liquid chromatography
DMSO	dimethyl sulphoxide
DNA-PK	DNA-dependent protein kinase
dNTP	deoxyribonucleotide triphosphate
DRR	distal regulatory region
EBS	epidermolysis bullosa simplex
EDC	epidermal differentiation complex
EDTA	ethylenediaminetetraacetic acid

EFAD	essential fatty acid deficiency
FGS	future generation sequencing
FISH	fluorescent <i>in situ</i> hybridisation
<i>FLG</i>	filaggrin gene
GSK3	glycogen synthase kinase 3
GWAS	genome-wide association studies
H&E	haematoxylin & eosin
HA	heteroduplex analysis
HEX	hexachloro-fluorescein
HMG-coA	hydroxymethylglutaryl coA reductase
HTSS	hypotrichosis simplex of the scalp
IL	interleukin
IV	ichthyosis vulgaris
<i>IVL</i>	involucrin gene
KLK5	kallikrein 5
KORA	Co-operative Health Research in the Region of Augsburg
LCE	late cornified envelope proteins
LD	linkage disequilibrium
LEKTI	lymphoepithelial kazal-type related inhibitor
<i>LOR</i>	loricrin gene
MAF	minor allele frequency
MgCl ₂	magnesium chloride
MHC	major histocompatibility complex
NGS	next generation sequencing
NMF	natural moisturising factor

NOD	nucleotide-binding oligomerisation domain
NPV	negative predictive value
NSC	National Skin Centre
NUH	National University Hospital
oSCORAD	objective SCORAD
<i>P. acnes</i>	<i>Propionibacterium acnes</i>
PAD	peptidylarginine deiminase
PAMP	pathogen associated microbial patterns
PC	pachyonychia congenita
PCA	pyrrolidone carboxylic acid
PCR	polymerase chain reaction
PCSK6	proprotein convertase subtilisin/kexin type 6
PEP1	profilaggrin endopeptidase
PPAR	peroxisome-proliferator-activated receptor
PPase	protein phosphatase
PPV	positive predictive value
PRR (Chapter 1)	pattern recognition receptor
PRR (Chapter 2)	proximal regulatory region
PS	psoriasis
PTC	premature-termination-codon
PTT	protein truncation test
RDEB	recessive dystrophic epidermolysis bullosa
SCCE	stratum corneum chymotryptic enzyme
SCORAD	SCORing Atopic Dermatitis
SCTE	stratum corneum tryptic enzyme

SD	standard deviation
SNP	single nucleotide polymorphism
<i>SPINK5</i>	serine protease inhibitor Kazal type 5 gene
SPRR	small proline-rich proteins
SPT	skin prick test
SSCP	single stranded conformation polymorphism
<i>STS</i>	steriod sulphatase gene
TEWL	trans-epidermal water loss
TGM	transglutaminase
Th2	T-helper type 2
TLR	Toll-like receptor
UCA	urocanic acid
UTR	untranslated region
XLI	X-linked ichthyosis

ABSTRACT

One of the most important roles of the skin is the formation of an effective barrier to prevent desiccation as well as to keep out foreign pathogens and allergens. This is a tightly regulated process and involves many structural proteins, lipids, enzymes and biochemical components. One of the proteins that has an indispensable role in barrier formation is filaggrin, which is encoded by the filaggrin gene (*FLG*) that lies within a cluster of epidermal genes known as the epidermal differentiation complex (EDC) on chromosome 1q21. Recent studies in Europe have shown that null mutations in *FLG* lead to the loss of the filaggrin protein; this is the underlying genetic cause of ichthyosis vulgaris (IV) and is a significant predisposing factor for atopic dermatitis (AD) and other atopic conditions such as asthma, allergic rhinitis and food allergy. In this thesis, the critical role of *FLG*-null mutations was examined and confirmed as a strong predisposing factor for AD in Singaporean Chinese patients. In addition, AD patients with *FLG* mutations also showed an increased susceptibility for recurrent skin infections. Interestingly, a diverse and wide spectrum of *FLG*-null mutations was identified in the Singaporean Chinese population, as opposed to the dominance of a few common *FLG* mutations in Europe. This result highlighted discrete genetic variations between different ethnic groups. *FLG*-null mutations were also shown to have significant gene modifying effects on other skin barrier genes such as steroid sulphatase gene (*STS*) to exacerbate the phenotype of X-linked ichthyosis (XLI). Next, the effect of *FLG*-null mutations on other complex conditions such as acne vulgaris and childhood

peanut sensitisation was investigated but no significant association of *FLG* mutations with these diseases were observed in the Singaporean Chinese population. Lastly, a study was attempted to search for a candidate gene for psoriasis within the EDC, through the use of fine mapping techniques. With the advent of faster and cheaper next generation sequencing (NGS) in the near future, the quest for susceptibility factors in complex traits will increase in effectiveness and speed.
